

# Manual for the JHU generator

For simulation of a single-produced resonance at hadron colliders  
(version 4.5.2, release date February 16, 2014)

The generator from [1–3] is a model-independent generator for studying spin and parity properties of new resonances.  
Please cite [1–3] if using the generator.

The code can be downloaded from [4]. The generator outputs LHE files which can be passed to parton shower programs for hadronization. Only relative values of cross sections are supposed to produce meaningful results, while absolute values are often subject to an arbitrary normalization.

Additionally, the package now includes code for computing the matrix elements standalone which can be used in a numerical matrix element analysis.

## I. INSTALLATION

Register and download the package from [www.pha.jhu.edu/spin](http://www.pha.jhu.edu/spin) and untar the file. Go to the directory JHUGenerator where the code exists for generating events with the JHU Generator. In the `makefile`, you have two options for compiler, `Comp = ifort` or `Comp = gfort`. Then simply compile with:

```
$ make
```

## II. CONFIGURATION

There are two ways to configure the program, from the command line and in the file `mod_Parameters.F90`. For documentation from the command line, one can use `JHUGen help`. In addition, the command line configurables are defined in the file `main.F90`. When one change the fortran code directly, one should also recompile the code for changes to take effect. In general, command-line configuration handles general event properties while the configuration file handles all of the couplings and physics handles.

### A. Command line configuration

The list of command line configurables and the default values are (also defined in the `README`):

```
Collider:    1=LHC, 2=Tevatron, 0=e+e-
Process:     0=spin-0, 1=spin-1, 2=spin-2 resonance, 50=pp/ee->VH,
              60=weakVBF, 61=pp->Hjj
MReso:       resonance mass (default=126.00), format: yyyy.xx
DecayMode1:   decay mode for vector boson 1 (Z/W+/gamma)
DecayMode2:   decay mode for vector boson 2 (Z/W-/gamma)
              0=Z->2l, 1=Z->2q, 2=Z->2tau, 3=Z->3nu,
              4=W->lnu, 5=W->2q, 6=W->taunu,
              7=gamma, 8=Z->2l+2tau,
              9=Z->anything, 10=W->lnu+taunu, 11=W->anything
PChannel:    0=g+g, 1=q+qb, 2=both
OffXVV:      off-shell option for resonance(X),or vector bosons(VV)
PDFSet:      1=CTEQ6L1(2001), 2=MSTW(2008),
              2xx=MSTW with eigenvector set xx=01..40)
VegasNc0:    number of evaluations for integrand scan
VegasNc1:    number of evaluations for accept-reject sampling
VegasNc2:    number of events for accept-reject sampling
Unweighted:  0=weighted events, 1=unweighted events
Interf:      0=neglect interference for 4f final states,
              1=include interference
DataFile:    LHE output file
ReadLHE:    LHE input file from external file (only spin-0)
```

A few more details on some particular parameters:

- **VegasNc0,1,2:** For unweighted event generation VegasNc0 specifies the number of evaluations for the initial integrand scan. The actual event generation is controlled by either VegasNc1 or VegasNc2. VegasNc1 specifies the number of tries in the accept/reject phase and VegasNc2 is the number of generated events. When generating unweighted events in ReadLHE mode, both VegasNc1 or VegasNc2 can be used to specify the number of generated events. For the generation of weighted events VegasNc1 specifies the number of evaluations for each of 5 iterations during the initial integrand scan. VegasNc2 gives the (approximate) number of generated weighted events.
- **OffXVV:** The program does not work for  $ZZ$  or  $WW$  if you set them to be on-shell (`OffXVV="000"`) and the mass of the  $X$  resonance to be below the  $m_{VV}$  threshold. In general, the more off-shell the process, or the more "1" you have, the less efficient the VegasNc1 evaluations are. Specifically, if you are interested then, in producing a resonance with mass below threshold  $m_{VV}$  with a very narrow resonance, it is most efficient to generate with `OffXVV="011"`

- **PChannel:** This parameter is only meaningful in the spin-2 case. For spin-0, production is possible only via the  $gg$  process and for spin-1, production is only possible via the  $q\bar{q}$  process.
- **DecayMode2=7** note: Valid for spin-0 and spin-2, only OffXVV=000 or 100 are possible.
- **VegasNc** note: **VegasNc1** allows the user to set the number of tries for the reject/accept method, **VegasNc2** allows the user to let the program run until the number of events is generated.

Then, as an example of running the generator, you could do:

- gg production:

```
./JHUGen Collider=1 Process=0 VegasNc2=100000 PChannel=0 OffXVV=011 DecayMode1=0 DecayMode2=0 \\
Unweighted=.true. DataFile=test1
```

-  $ggH \rightarrow Z\gamma$

```
./JHUGen DecayMode1=0 DecayMode2=7 OffXVV=010
```

- VH (both  $pp$  and  $e^+e^-$  Collider options possible):

```
./JHUGen Collider=1 Process=50 Unweighted=1 VegasNc2=100000 OffXVV=011 DataFile=test2
```

- VBF:

```
./JHUGen Collider=1 Process=60 Unweighted=1 VegasNc2=100000 OffXVV=011 DataFile=test2
```

- H+jj:

```
./JHUGen Collider=1 Process=61 Unweighted=1 VegasNc2=100000 OffXVV=011 DataFile=test3
```

For generating Higgs decay in VBF, H+JJ, or VH production modes by the JHU generator or NLO gluon fusion with another generator (e.g. POWHEG), use JHU generator in LHE conversion mode and specify the decay mode of interest (ZZ, WW, gam gam, Z gam), while the SM fermionic decays may be generated by Pythia without loss of generality.

## B. Configuration in parameter file

In the file `mod_Parameters.F90`, one does all the configuration of the couplings of the resonance. After modifying this file, one needs to recompile.

### 1. General parameters

Each generation run is different when this is `.true.`

```
seed_random = .true.
```

In the case when `PChannel=2` for a spin-2 resonance, the user can define an approximate ratio of the production of  $gg$  and  $q\bar{q}$  production.

```
fix_channels_ratio = .true.
channels_ratio_fix = 0.25d0      ! desired ratio of
                                  !  $N_{qq}/(N_{qq}+N_{gg})$ 
```

For final states with a Z-boson decaying into  $f\bar{f}$ , intermediate off-shell photons can be included by switching

```
logical, public, parameter :: includeGammaStar = .false.
```

to the value `.true..` In such case, a lower cut on the photon invariant mass has to be placed in order to avoid the collinear singularity. This cutoff parameter is controlled by

```
real(8),parameter :: MPhotonCutoff = 4d0*GeV.
```

Only for final states with 4 same flavor fermions , one can include interference effects between the leptons. The interference is controlled by the command line parameter:

Interf=0 or 1

For the generation of weighted events (command line Unweighted=0) an LHE output file is created if logical, public, parameter :: writeWeightedLHE = .false.

is set to .true..

The remaining parameters are more-or-less self-explanatory:

```

! we are using units of 100GeV, i.e. Lambda=10 is 1TeV

                                                               ! (set to M_Reso in main.F90)
                                                               ! LHC hadronic center of mass energy
real(8), public, parameter :: LHC_Energy=14000d0  *GeV
                                                               ! Tevatron hadronic center of mass energy
real(8), public, parameter :: TEV_Energy=1960d0  *GeV
                                                               ! Linear collider center of mass energy
real(8), public, parameter :: ILC_Energy=250d0   *GeV
                                                               ! e+ polarization. 0: no polarization, 100:
                                                               ! helicity = 1, -100: helicity = -1
real(8), public, parameter :: POL_A = 0d0
                                                               ! e- polarization. 0: no polarization, 100:
                                                               ! helicity = 1, -100: helicity = -1
real(8), public, parameter :: POL_B = 0d0
                                                               ! default to false so H in
                                                               ! V > VH (Process = 50) does not decay
logical, public, parameter :: H_DK =.true.                  ! jet min pt
                                                               ! jet deltaR, antikt algorithm
real(8), public, parameter :: ptjetcut = 15d0*GeV
real(8), public, parameter :: Rjet = 0.5d0
```

The branching fractions of  $Z$  and  $W$  bosons depend on the above input parameter and can slightly vary from the given PDG measurements. Those branchings can be rescaled with the parameters below.

```

real(8), public, parameter :: scale_alpha_Z_uu = 1.04282d0 ! scaling factor of alpha (~partial width) for Z_uu
real(8), public, parameter :: scale_alpha_Z_dd = 1.04282d0 ! scaling factor of alpha (~partial width) for Z_dd
real(8), public, parameter :: scale_alpha_Z_ll = 1d0        ! scaling factor of alpha (~partial width) for Z_ll
real(8), public, parameter :: scale_alpha_Z_nn = 1d0        ! scaling factor of alpha (~partial width) for Z_nn
real(8), public, parameter :: scale_alpha_W_ud = 1.0993819d0 ! scaling factor of alpha (~partial width) for W_ud
real(8), public, parameter :: scale_alpha_W_ln = 1d0        ! scaling factor of alpha (~partial width) for W_ln
```

These default values rescale the branchings to include the NLO QCD corrections  $(1 + \alpha_s/\pi)$ .

## 2. Spin-0 parameters

*N.B. The parameters "ptjetcut" and "Rjet" only apply to Process=60,61.*

The **\*hg\*** parameters control the coupling of a spin-0 resonance to gluons in the production mechanism. In practice, the production parameters are not having a large effect since angular corrections from the production mechanism are lost for spinless particles. The **\*hz\*** parameters control the decay into  $Z$  and  $W$  bosons. One has the options to set the spin-0 couplings either from Eq.(9) or Eq.(11) from Ref. [2]. To switch between the two, use the parameter **generate\_as**. We now allow for  $q^2$  dependent form factors as described in Ref. [3] and given in more detail in the equation below:

$$g_i(q_1^2, q_2^2) = g_i^{\text{SM}} + g'_i \frac{\Lambda_i^4}{(\Lambda_i^2 + |q_1^2|)(\Lambda_i^2 + |q_2^2|)}$$

$$+ g''_i \frac{(|q_1^2| + |q_2^2|)}{\Lambda_i^2} + g'''_i \frac{(|q_1^2| - |q_2^2|)}{\Lambda_i^2} + g''''_i \frac{|q_1^2||q_2^2|}{\Lambda_i^4} + g'''''_i \frac{(|q_1^2|^2 + |q_2^2|^2)}{\Lambda_i^4} + g''''''_i \frac{(|q_1^2|^2 - |q_2^2|^2)}{\Lambda_i^4}$$

The user has the option to choose between these functional forms, where the term multiplying  $g'_i$  corresponds to the full functional form and the  $g''_i \dots g''''''_i$  correspond to an expansion in  $\Lambda^2$ . All parameters can be modified in `mod_Parameters.F90` by:

```

!-- parameters that define on-shell spin 0 coupling to SM fields, see note
logical, public, parameter :: generate_as = .false.
complex(8), public, parameter :: ahg1 = (1.0d0,0d0)
complex(8), public, parameter :: ahg2 = (0.0d0,0d0)
complex(8), public, parameter :: ahg3 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ahz1 = (1.0d0,0d0)
complex(8), public, parameter :: ahz2 = (0.0d0,0d0) ! this coupling does not contribute for gamma+ga
complex(8), public, parameter :: ahz3 = (0.0d0,0d0) ! pseudoscalar

!-- parameters that define off-shell spin 0 coupling to SM fields, see note
complex(8), public, parameter :: ghg2 = (1.0d0,0d0)
complex(8), public, parameter :: ghg3 = (0.0d0,0d0)
complex(8), public, parameter :: ghg4 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ghz1 = (2.0d0,0d0)
complex(8), public, parameter :: ghz2 = (0.0d0,0d0)
complex(8), public, parameter :: ghz3 = (0.0d0,0d0)
complex(8), public, parameter :: ghz4 = (0.0d0,0d0) ! pseudoscalar

!-- parameters that define  $q^2$  dependent form factors
complex(8), public, parameter :: ghz1_prime = (0.0d0,0d0)
complex(8), public, parameter :: ghz1_prime2= (0.0d0,0d0)
complex(8), public, parameter :: ghz1_prime3= (0.0d0,0d0)
complex(8), public, parameter :: ghz1_prime4= (0.0d0,0d0)

complex(8), public, parameter :: ghz2_prime = (0.0d0,0d0)
complex(8), public, parameter :: ghz2_prime2= (0.0d0,0d0)
complex(8), public, parameter :: ghz2_prime3= (0.0d0,0d0)
complex(8), public, parameter :: ghz2_prime4= (0.0d0,0d0)

complex(8), public, parameter :: ghz3_prime = (0.0d0,0d0)
complex(8), public, parameter :: ghz3_prime2= (0.0d0,0d0)
complex(8), public, parameter :: ghz3_prime3= (0.0d0,0d0)
complex(8), public, parameter :: ghz3_prime4= (0.0d0,0d0)

complex(8), public, parameter :: ghz4_prime = (0.0d0,0d0)
complex(8), public, parameter :: ghz4_prime2= (0.0d0,0d0)
complex(8), public, parameter :: ghz4_prime3= (0.0d0,0d0)

```

```
complex(8), public, parameter :: ghz4_prime4= (0.0d0,0d0)
real(8),    public, parameter :: Lambda_z1 = 10000d0*GeV
real(8),    public, parameter :: Lambda_z2 = 10000d0*GeV
real(8),    public, parameter :: Lambda_z3 = 10000d0*GeV
real(8),    public, parameter :: Lambda_z4 = 10000d0*GeV
```

If the switch `includeGammaStar` is set to `.true.`, then intermediate off-shell photons are included for  $Z$  boson final states. Their couplings to the spin-0 resonance are controlled by separate parameters,

```
complex(8), public, parameter :: ghzgs2 = (0.00d0,0d0)
complex(8), public, parameter :: ghzgs3 = (0.00d0,0d0)
complex(8), public, parameter :: ghzgs4 = (0.00d0,0d0)
complex(8), public, parameter :: ghgsgs2 = (0.00d0,0d0)
complex(8), public, parameter :: ghgsgs3 = (0.00d0,0d0)
complex(8), public, parameter :: ghgsgs4 = (0.00d0,0d0)
```

where the first three correspond to  $Z\gamma^*$  couplings and the latter three corresponds to  $\gamma^*\gamma^*$  interactions. These two sets of parameters also control the coupling strength in final states with on-shell photons, i.e.  $Z\gamma$  and  $\gamma\gamma$ .

### 3. Spin-1 parameters

The parameters below represent the couplings given in Eq. (16) from Ref. [2]. The `*left*` and `*right*` parameters control the production of the spin-1 resonance while the `*_v` and `*_a` parameters control the decay.

```
!---parameters that define spin 1 coupling to SM fields, see note
complex(8), public, parameter :: zprime_qq_left = (1.0d0,0d0) ! see note Eq. (4)
complex(8), public, parameter :: zprime_qq_right = (0.0d0,0d0)
complex(8), public, parameter :: zprime_zz_v = (1.0d0,0d0)! =1 for JP=1-
complex(8), public, parameter :: zprime_zz_a = (0.0d0,0d0)! =1 for JP=1+
```

### 4. Spin-2 parameters

The `a*` parameters control the coupling of a spin-2 resonance to gluons in the production mechanism. The `b*` and `c*` parameters control the decay. One has the options to set the spin-2 couplings either from Eq.(18) or Eq.(19) from Ref. [2]. To switch between the two, use the parameter `generate_bis`.

```
logical, public, parameter :: generate_bis = .true.
logical, public, parameter :: use_dynamic_MG = .true. ! .true. (=default),
  ! the spin-2 resonance mass with MG^2=(p1+p2)^2, otherwise fixed at M_Reso^2.

complex(8), public, parameter :: a1 = (1.0d0,0d0) ! g1 -- c.f. note
complex(8), public, parameter :: a2 = (0.0d0,0d0) ! g2
complex(8), public, parameter :: a3 = (0.0d0,0d0) ! g3
complex(8), public, parameter :: a4 = (0.0d0,0d0) ! g4
complex(8), public, parameter :: a5 = (0.0d0,0d0) ! pseudoscalar, g8

complex(8), public, parameter :: graviton_qq_left = (1.0d0,0d0)! graviton coupling to quarks
complex(8), public, parameter :: graviton_qq_right = (1.0d0,0d0)

complex(8), public, parameter :: b1 = (1.0d0,0d0)
complex(8), public, parameter :: b2 = (0.0d0,0d0)
complex(8), public, parameter :: b3 = (0.0d0,0d0)
complex(8), public, parameter :: b4 = (0.0d0,0d0)
complex(8), public, parameter :: b5 = (0.0d0,0d0)
complex(8), public, parameter :: b6 = (0.0d0,0d0)
complex(8), public, parameter :: b7 = (0.0d0,0d0)
```

```

complex(8), public, parameter :: b8 = (0.0d0,0d0)
complex(8), public, parameter :: b9 = (0.0d0,0d0)
complex(8), public, parameter :: b10 =(0.0d0,0d0)

complex(8), public, parameter :: c1 = (1.0d0,0d0)
complex(8), public, parameter :: c2 = (0.0d0,0d0)
complex(8), public, parameter :: c3 = (0.0d0,0d0)
complex(8), public, parameter :: c41= (0.0d0,0d0)
complex(8), public, parameter :: c42= (0.0d0,0d0)
complex(8), public, parameter :: c5 = (0.0d0,0d0)
complex(8), public, parameter :: c6 = (0.0d0,0d0)
complex(8), public, parameter :: c7 = (0.0d0,0d0)

```

### III. EXAMPLES

The below examples are not meant to be a complete set, but rather some interesting and relevant cases. In many cases, the example is not the only way to produce such a scenario.

#### A. $J^P = 0_m^+$ resonance, $X \rightarrow ZZ$ or $WW$

```

logical, public, parameter :: generate_as = .true.

complex(8), public, parameter :: ahg1 = (1.0d0,0d0)
complex(8), public, parameter :: ahg2 = (0.0d0,0d0)
complex(8), public, parameter :: ahg3 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ahz1 = (1.0d0,0d0)
complex(8), public, parameter :: ahz2 = (0.0d0,0d0)

```

**F. Cross-section calculation and fraction notation**

For a vector boson coupling, we can represent the four independent parameters by two fractions ( $f_{g2}$  and  $f_{g4}$ ) and two phases ( $\phi_{g2}$  and  $\phi_{g4}$ ), defined for the  $HZZ$  and  $HWW$  couplings as follows (ignoring  $g_3$ )

$$f_{gi} = \frac{|g_i|^2 \sigma_i}{|g_1|^2 \sigma_1 + |g_2|^2 \sigma_2 + |g_4|^2 \sigma_4}; \quad \phi_{gi} = \arg \left( \frac{g_i}{g_1} \right).$$

In order to obtain the cross-sections  $\sigma_i$  corresponding to the  $g_i = 1$  coupling, generate large enough (e.g. VegasNc1=1000000, VegasNc2=50000000) number of weighted (`Unweighted=0`) with the corresponding couplings setup ( $g_i = 1$ ,  $g_{j \neq i} = 0$ ).

**IV. JHU GENERATOR MATRIX ELEMENTS (JHUGENMELA)**

**A. Native matrix elements**

After extracting the code, you can go to the directory `JHUGenMELA` to find code for computing matrix elements directly. To compile the code, simple do:

```
$ make
```

**Please take note: The setup is configured for gfort + gcc version 4.1.2 20080704 (Red Hat 4.1.2-50) and it is highly dependent on the compiler version. Please configure for your own setup accordingly.** (Using 'nm' command will help decipher the module names you will need)

The usage of the package is straight-forward and an example is given in `testprogram.c`. There are 6 main modules allowing both specific production process and production-independent calculation:

- "modhiggs\\_evalamp\\_gg\\_h\\_vv": spin-0 matrix elements for  $gg$  initiated processes
- "modzprime\\_evalamp\\_qqb\\_zprime\\_vv": spin-1 matrix elements for  $q\bar{q}$  initiated processes
- "modgraviton\\_evalamp\\_gg\\_g\\_vv": spin-2 matrix elements for  $gg$  initiated processes
- "modgraviton\\_evalamp\\_qqb\\_g\\_vv": spin-2 matrix elements for  $q\bar{q}$  initiated processes
- "modzprime\\_evalamp\\_zprime\\_vv": spin-1 matrix elements production-independent
- "modgraviton\\_evalamp\\_g\\_vv": spin-2 matrix elements production-independent

The inputs are the 4-vectors of the incoming patrons and outgoing particles in the CM frame of the object  $X$ . In addition the mass and width of the resonance are required as well as the ID of the outgoing particles. Finally the last set of inputs are the couplings themselves. They are arrays for parameters for a given spin hypothesis which mirror the parameters configurable in `mod_Parameters.F90`. As an example, the arrays are initialized in `testprogram.c`.

## B. Interface with MCFM

Instructions for setting up the JHUGenMELA with MCFM are in the file `JHUGenMELA/ggZZ_MCFM/README`.

## V. RELEASE NOTES

In going from v4.3.2 to v4.5.2, the updates are as follows:

- add an option of intermediate photons for the modes with Z-bosons
- more flexibility for  $q^2$ -dependent form factors
- option of hadronic branching rescaling (NLO QCD corrections) for inclusive decays
- synchronize JHUGenMELA with the generator and with MCFM library v6.7

In going from v4.2.1 to v4.3.2, the updates are as follows:

- update LHE file format and index of partons
- improve log printout
- update ReadLHE mode:  $H \rightarrow Z\gamma$  output and more flexible input
- $VH$  production (replaces beta version)
- more flexibility for  $q^2$ -dependent form factors
- tune  $q^2$ -dependence of couplings for some of the spin- $2_h$  models
- synchronize JHUGenMELA with the generator

In going from v4.0.x to v4.2.x, the updates are as follows:

To JHUGenerator:

- Fix BR in "all" decay mode

- Updates to LHE output
- Option to print out CS\_max, output for g' and Lambdas
- Introduction of AnalyticMELA for  $ee \rightarrow ZH$  and  $pp \rightarrow ZH$  and analytic parton distribution functions

In going from v3.1.x to v4.0.x, the updates are as follows:

To JHUGenerator:

- Addition of VBF and Hjj process channels
- Possibility to read in VBF LHE event files

To JHUGenMELA:

- Interface with the MCFM program for ggZZ process
- Matrix elements for VBF and Hjj processes

In going from v2.2.6 to v3.1.8, the updates are as follows:

To JHUGenerator:

- Capability reading LHE files with Higgs boson production, allows NLO production of spin-0;
- Extended the list of final state combinations;
- Log messages, lhe file headers, and minor cleanup.
- Updates to deal with non-zero lepton masses, lhe file format, and adjust default settings (e.g. lepton interference applied by default and can be configured in command line)

To JHUGenMELA:

- Production-independent JHUGenMELA for spin-0, 1, 2;
- Complex couplings in JHUGenMELA input.

In going from v2.2.3 to v2.2.6, the updates are as follows:

- A small fix which corrects the *relative fraction* between the  $2e2\mu$  and  $4e/4\mu$  channels when using interference
- beta version is still under development
- $q\bar{q} \rightarrow$  spin-2 production is more safely performed with settings PChannel = 2 and  $q\bar{q}$  fraction = 1.

In going from v2.1.3 to v2.2.3, the updates are as follows:

- Fix interference and randomization in the *beta* version
- Add the JHUGenMELA modules
- Small change for compilation on Mac OSX platforms
- Fix for tau masses in  $W$  decays

In going from v2.0.2 to v2.1.x, the updates are as follows:

- Histograms are written in file (default: ./data/output.dat) and no longer on the screen. How to understand the histogram data and how to plot is briefly described in the output.dat file.
- Added tau masses
- Added lepton interference in the ZZ4l final state
- Added switch generate\_as to choose couplings in spin-0 case (works for on- and off-shell resonance). The default is ".false.".
- Added the possibility to change graviton-quark couplings. The new parameters are `graviton_qq_left`, `graviton_qq_right` and correspond to  $0.5*(1-\gamma^5)$  and  $0.5*(1+\gamma^5)$  helicity projectors, respectively. Up to now the coupling was always vector-like. This is also the new default, `graviton_qq_left` = `graviton_qq_right` = 1.
- The random seed is now fixed with gfortran.
- The call "./JHUGen help" prints out all available command line options
- Added new command line option "Unweighted=0 or 1" (default is 1)

## APPENDIX A: SPECIFIC CONFIGURATIONS

We define configurations for certain models which are defined in Table 1 of [2].

### 1. "SM-like spin-zero", $0^+$

```

!-- parameters that define on-shell spin 0 coupling to SM fields, see note
logical, public, parameter :: generate_as = .false.
complex(8), public, parameter :: ahg1 = (1.0d0,0d0)
complex(8), public, parameter :: ahg2 = (0.0d0,0d0)
complex(8), public, parameter :: ahg3 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ahz1 = (1.0d0,0d0)
complex(8), public, parameter :: ahz2 = (0.0d0,0d0) ! this coupling does not contribute for gamma+gamma final states
complex(8), public, parameter :: ahz3 = (0.0d0,0d0) ! pseudoscalar

!-- parameters that define off-shell spin 0 coupling to SM fields, see note
complex(8), public, parameter :: ghg2 = (1.0d0,0d0)
complex(8), public, parameter :: ghg3 = (0.0d0,0d0)
complex(8), public, parameter :: ghg4 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ghz1 = (1.0d0,0d0)
complex(8), public, parameter :: ghz2 = (0.0d0,0d0)
complex(8), public, parameter :: ghz3 = (0.0d0,0d0)
complex(8), public, parameter :: ghz4 = (0.0d0,0d0) ! pseudoscalar

```

### 2. "Higher order spin-zero", $0_h^+$

```

!-- parameters that define on-shell spin 0 coupling to SM fields, see note
logical, public, parameter :: generate_as = .false.
complex(8), public, parameter :: ahg1 = (1.0d0,0d0)
complex(8), public, parameter :: ahg2 = (0.0d0,0d0)
complex(8), public, parameter :: ahg3 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ahz1 = (1.0d0,0d0)
complex(8), public, parameter :: ahz2 = (0.0d0,0d0) ! this coupling does not contribute for gamma+gamma final states
complex(8), public, parameter :: ahz3 = (0.0d0,0d0) ! pseudoscalar

!-- parameters that define off-shell spin 0 coupling to SM fields, see note
complex(8), public, parameter :: ghg2 = (1.0d0,0d0)
complex(8), public, parameter :: ghg3 = (0.0d0,0d0)
complex(8), public, parameter :: ghg4 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ghz1 = (0.0d0,0d0)
complex(8), public, parameter :: ghz2 = (1.0d0,0d0)
complex(8), public, parameter :: ghz3 = (0.0d0,0d0)
complex(8), public, parameter :: ghz4 = (0.0d0,0d0) ! pseudoscalar

```

### 3. "Pseudoscalar spin-zero", $0^-$

```

!-- parameters that define on-shell spin 0 coupling to SM fields, see note
logical, public, parameter :: generate_as = .false.
complex(8), public, parameter :: ahg1 = (1.0d0,0d0)
complex(8), public, parameter :: ahg2 = (0.0d0,0d0)
complex(8), public, parameter :: ahg3 = (0.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ahz1 = (1.0d0,0d0)
complex(8), public, parameter :: ahz2 = (0.0d0,0d0) ! this coupling does not contribute for gamma+gamma final states
complex(8), public, parameter :: ahz3 = (0.0d0,0d0) ! pseudoscalar

!-- parameters that define off-shell spin 0 coupling to SM fields, see note
complex(8), public, parameter :: ghg2 = (0.0d0,0d0)
complex(8), public, parameter :: ghg3 = (0.0d0,0d0)
complex(8), public, parameter :: ghg4 = (1.0d0,0d0) ! pseudoscalar
complex(8), public, parameter :: ghz1 = (0.0d0,0d0)
complex(8), public, parameter :: ghz2 = (0.0d0,0d0)
complex(8), public, parameter :: ghz3 = (0.0d0,0d0)
complex(8), public, parameter :: ghz4 = (1.0d0,0d0) ! pseudoscalar

```

#### 4. "Vector spin-one", $1^-$

```
!---parameters that define spin 1 coupling to SM fields, see note
complex(8), public, parameter :: zprime_qq_left = (1.0d0,0d0)
complex(8), public, parameter :: zprime_qq_right = (0.0d0,0d0)

complex(8), public, parameter :: zprime_zz_a = (0.0d0,0d0)! =1 for JP=1+
```

#### 5. "Pseudovector spin-one", $1^+$

```
!---parameters that define spin 1 coupling to SM fields, see note
complex(8), public, parameter :: zprime_qq_left = (1.0d0,0d0)
complex(8), public, parameter :: zprime_qq_right = (0.0d0,0d0)
complex(8), public, parameter :: zprime_zz_v = (0.0d0,0d0)! =1 for JP=1-
complex(8), public, parameter :: zprime_zz_a = (1.0d0,0d0)! =1 for JP=1+
```

#### 6. "Minimal Graviton, spin-two", $2^+$

N.B. If an exclusive production mode is desired (e.g.  $q\bar{q}$  or  $gg$ ), this is handled at command-line configuration level via the PChannel variable.

```
